

## Data Communication and Net-Centric Computing

COSC 1111/2061/1110

### Lecture 12

## Emerging Networking Technologies

# Lecture Overview

---

## ❖ During this lecture, we will

- Classify emerging multimedia applications
- Understand Video Streaming, SIP etc.
- Identify the network services the apps need
- Learn Mechanisms for providing QoS Network components

## ❖ Recommended reading

- Chapter 19 (Stallings)

# Multimedia, Quality of Service: What is it?

**Multimedia applications:**  
network audio and video  
("continuous media")

## QoS

network provides  
application with *level of  
performance needed for  
application to function.*

# MM Networking Applications

---

## Classes of MM applications:

- 1) Streaming stored audio and video
- 2) Streaming live audio and video
- 3) Real-time interactive audio and video

**Jitter** is the variability of packet delays within the same packet stream

## Fundamental characteristics:

- ❖ Typically **delay sensitive**
  - end-to-end delay
  - delay jitter
- ❖ But **loss tolerant**: infrequent losses cause minor glitches
- ❖ Antithesis of data, which are loss intolerant but delay tolerant.

# Streaming Stored Multimedia

---

## Streaming:

- ❖ media stored at source
- ❖ transmitted to client
- ❖ streaming: client playout begins *before* all data has arrived
- ❖ timing constraint for still-to-be transmitted data: in time for playout

# Streaming Live Multimedia

---

## Examples:

- ❖ Internet radio talk show
- ❖ Live sporting event

## Streaming

- ❖ playback buffer
- ❖ playback can lag tens of seconds after transmission
- ❖ still have timing constraint

## Interactivity

- ❖ fast forward impossible
- ❖ rewind, pause possible!

# Interactive, Real-Time Multimedia

---

- ❖ **applications:** IP telephony, video conference, distributed interactive worlds
- ❖ **end-end delay requirements:**
  - audio: < 150 msec good, < 400 msec OK
    - ✓ includes application-level (packetization) and network delays
    - ✓ higher delays noticeable, impair interactivity
- ❖ **session initialization**
  - how does callee advertise its IP address, port number, encoding algorithms?

# Multimedia Over Today's Internet

**TCP/UDP/IP:** “best-effort service”

❖ *no* guarantees on delay, loss

? ? ? ? ?  
But you said multimedia apps requires ?  
QoS and level of performance to be  
? effective! ? ?

Today's Internet multimedia applications  
use application-level techniques to mitigate  
(as best possible) effects of delay, loss

# How should the Internet evolve to better support multimedia?

---

## Integrated services philosophy:

- ❖ Fundamental changes in Internet so that apps can reserve end-to-end bandwidth
- ❖ Requires new, complex software in hosts & routers

## Laissez-faire

- ❖ no major changes
- ❖ more bandwidth when needed
- ❖ content distribution, application-layer multicast
  - application layer

## Differentiated services philosophy:

- ❖ Fewer changes to Internet infrastructure, yet provide 1st and 2nd class service.

What's your opinion?

# Streaming Stored Multimedia

---

Application-level streaming techniques for making the best out of best effort service:

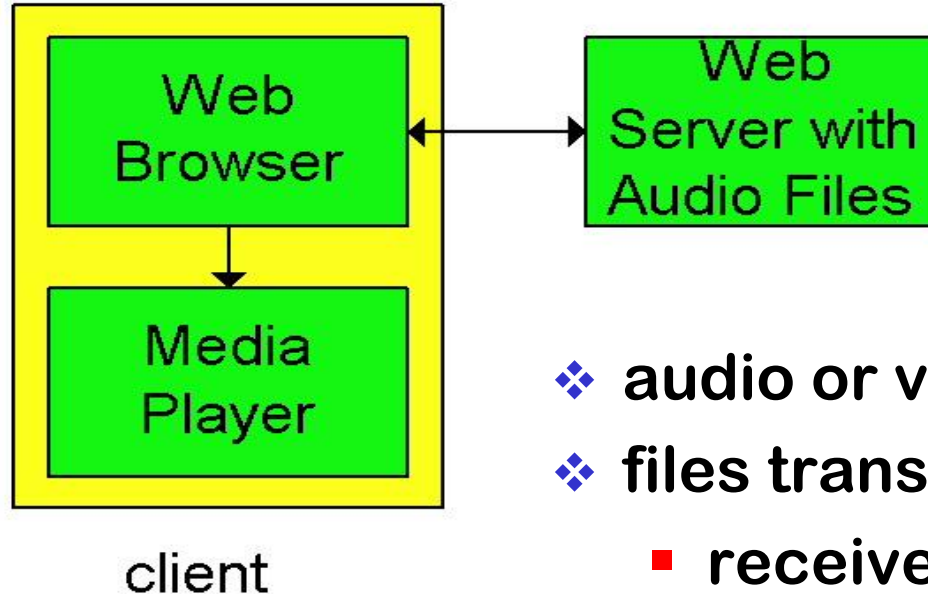

- client side buffering
- use of UDP versus TCP
- multiple encodings of multimedia

## Media Player

- ❖ jitter removal
- ❖ decompression
- ❖ error concealment
- ❖ graphical user interface w/ controls for interactivity

# Internet multimedia: simplest approach

---

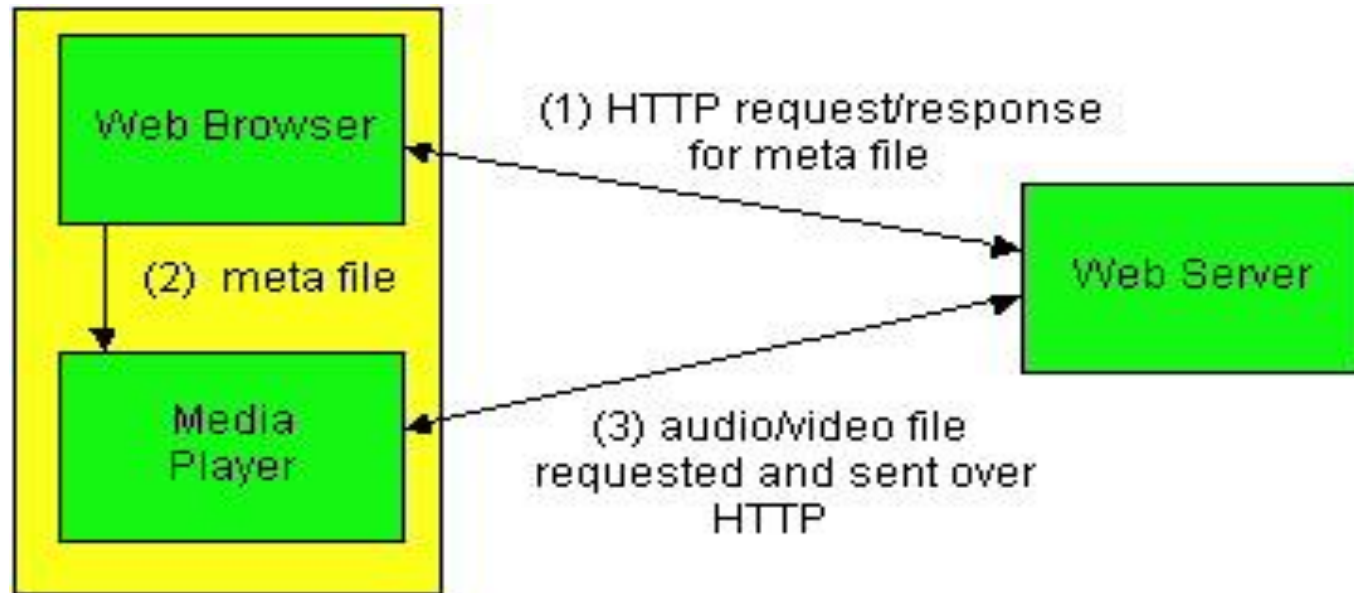

- ❖ audio or video stored in file
- ❖ files transferred as HTTP object
  - received in entirety at client
  - then passed to player

**audio, video not streamed:**

- ❖ no, “pipelining,” long delays until playout!

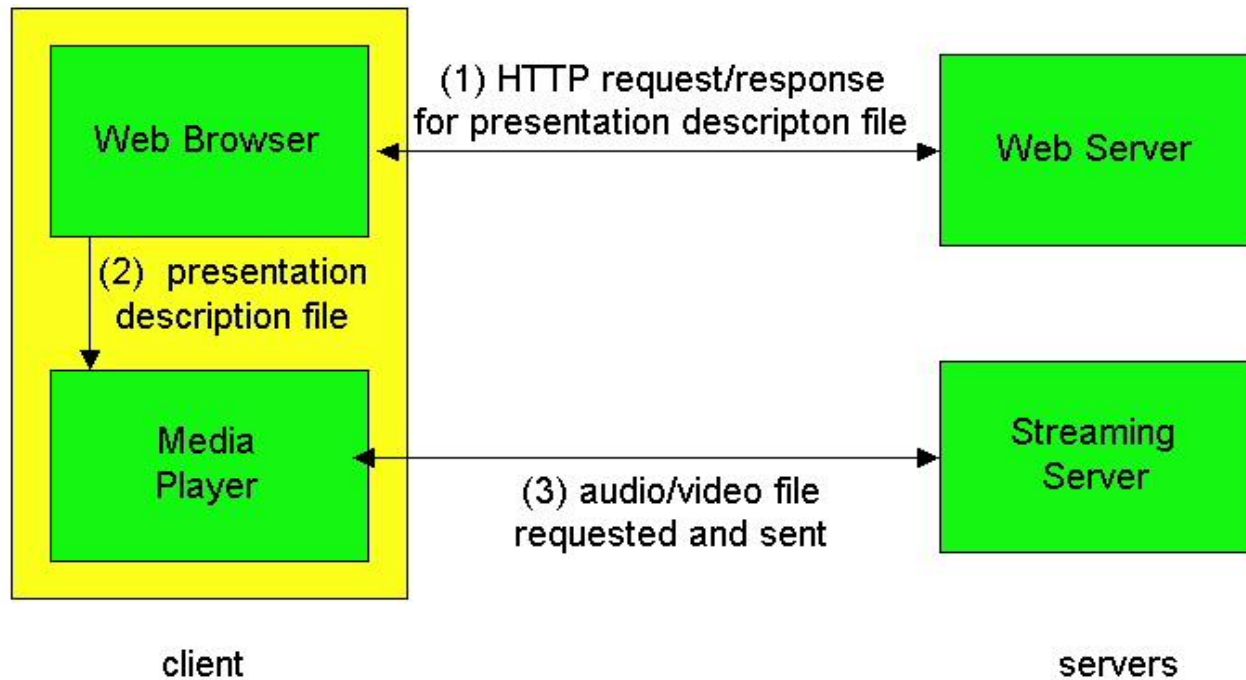

# Internet multimedia: streaming approach

---

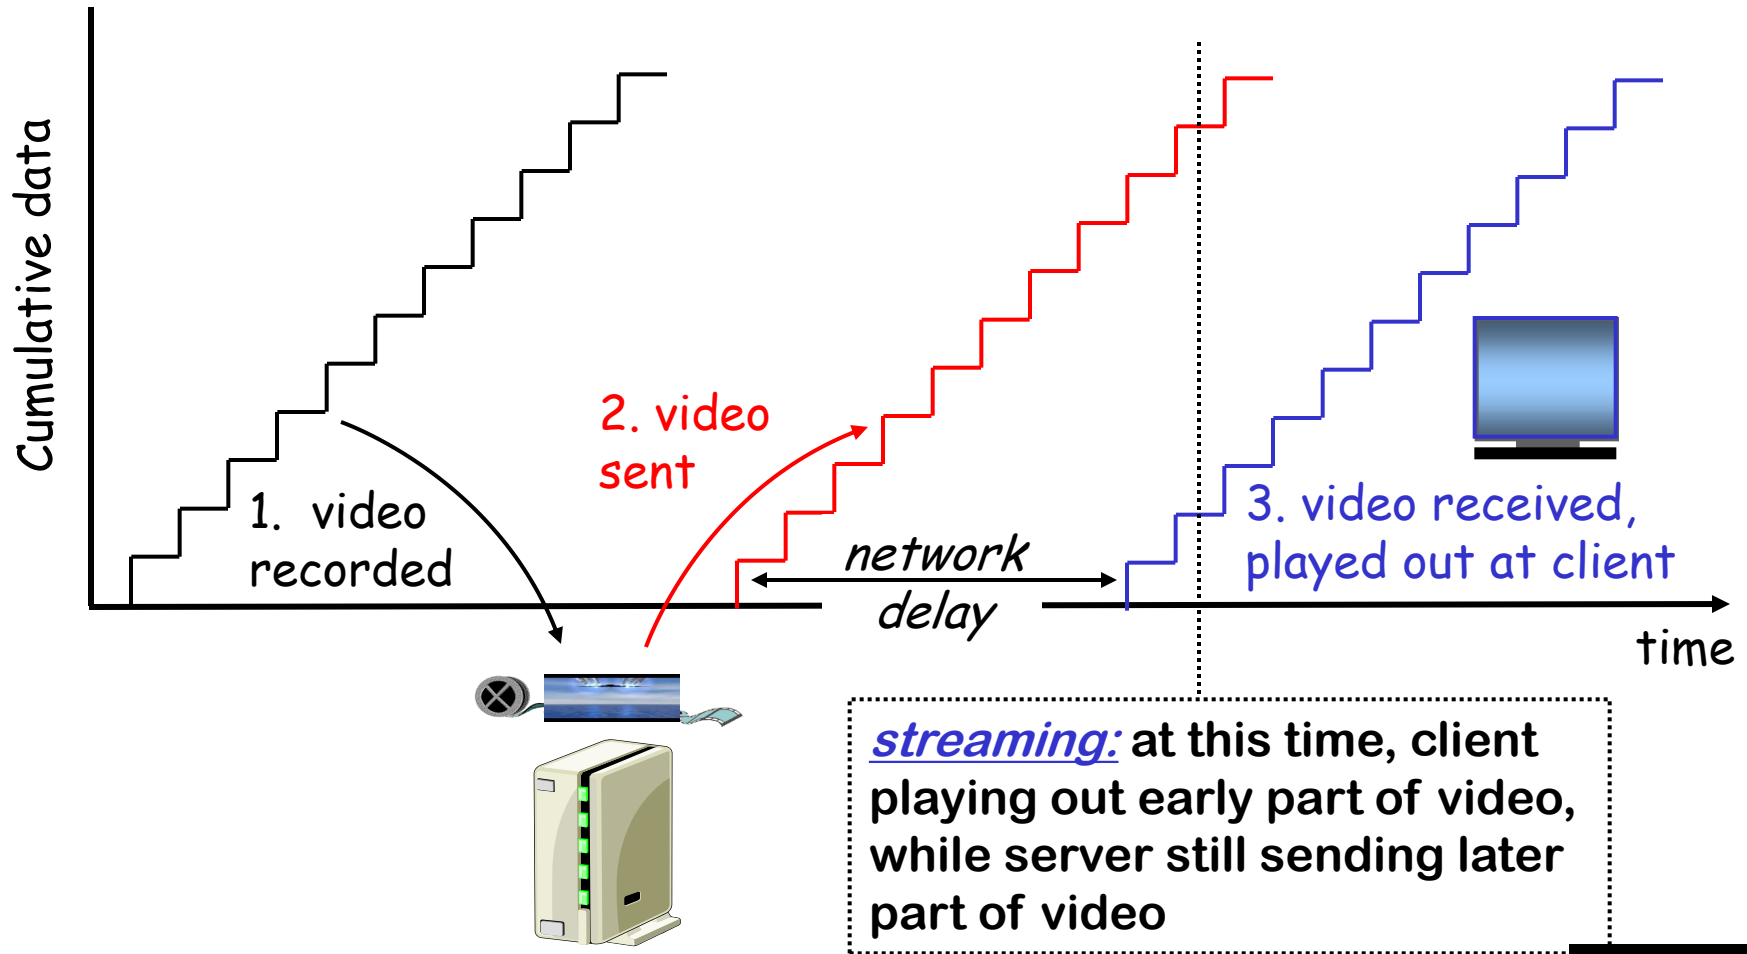

- ❖ browser GETs **metafile**
- ❖ browser launches player, passing metafile
- ❖ player contacts server
- ❖ server **streams** audio/video to player

# Streaming from a streaming server

- ❖ This architecture allows for non-HTTP protocol between server and media player
- ❖ Can also use UDP instead of TCP.

# Streaming Stored Multimedia and Buffering

# Streaming Multimedia: Client Buffering

---

- ❖ Client-side buffering, playout delay compensate for network-added delay, delay jitter

# Streaming Multimedia: UDP or TCP?

---

## UDP

- ❖ server sends at rate appropriate for client (oblivious to network congestion !)
  - often send rate = encoding rate = constant rate
  - then, fill rate = constant rate - packet loss
- ❖ short playout delay (2-5 seconds) to compensate for network delay jitter
- ❖ error recover: time permitting

## TCP

- ❖ send at maximum possible rate under TCP
- ❖ fill rate fluctuates due to TCP congestion control
- ❖ larger playout delay: smooth TCP delivery rate
- ❖ HTTP/TCP passes more easily through firewalls

## Streaming Multimedia: client rate(s)

**Q: how to handle different client receive rate capabilities?**

- 28.8 Kbps dialup
- 100Mbps Ethernet

**A: server stores, transmits multiple copies of video, encoded at different rates**

# Real-time interactive applications

- ❖ PC-2-PC phone
  - instant messaging services are providing this
  - Skype
- ❖ PC-2-phone
  - Dialpad
  - Net2phone
- ❖ videoconference with Webcams

## Introduce Internet Phone by way of an example

- speaker's audio: alternating talk spurts, silent periods.
  - 64 kbps during talk spurt
- pkts generated only during talk spurts
  - 20 msec chunks at 8 Kbytes/sec: 160 bytes data
- application sends UDP segment into socket every 20 msec during talkspurt.

# Internet Phone: Packet Loss and Delay

- ❖ **network loss:** IP datagram lost due to network congestion (router buffer overflow)
- ❖ **delay loss:** IP datagram arrives too late for playout at receiver
  - delays: processing, queueing in network; end-system (sender, receiver) delays
  - typical maximum tolerable delay: 400 ms
- ❖ **loss tolerance:** depending on voice encoding, losses concealed, packet loss rates between 1% and 10% can be tolerated.
- Consider the end-to-end delays of two consecutive packets: difference can be more or less than 20 msec

# Summary: Internet Multimedia: bag of tricks

- ❖ **use UDP** to avoid TCP congestion control (delays) for time-sensitive traffic
- ❖ client-side **adaptive playout delay**: to compensate for delay
- ❖ server side **matches stream bandwidth** to available client-to-server path bandwidth
  - chose among pre-encoded stream rates
  - dynamic server encoding rate
- ❖ **error recovery (on top of UDP)**
  - FEC, interleaving
  - retransmissions, time permitting
  - conceal errors: repeat nearby data

# Session Initiation Protocol (SIP)

---

- ❖ Session Initiation Protocol
- ❖ Comes from IETF

## SIP long-term vision

- ❖ All telephone calls and video conference calls take place over the Internet
- ❖ People are identified by names or e-mail addresses, rather than by phone numbers.
- ❖ You can reach the callee, no matter where the callee roams, no matter what IP device the callee is currently using.

# Setting up a call to a known IP address

Alice

167.180.112.24

Bob

193.64.210.89

- Alice's SIP invite message indicates her port number & IP address. Indicates encoding that Alice prefers to receive (PCM ulaw)

- Bob's 200 OK message indicates his port number, IP address & preferred encoding (GSM)

- SIP messages can be sent over TCP or UDP; here sent over RTP/UDP.

- Default SIP port number is 5060.

# Name translation and user locataion

---

- ❖ Caller wants to call callee, but only has callee's name or e-mail address.
- ❖ Need to get IP address of callee's current host:
  - user moves around
  - DHCP protocol
  - user has different IP devices (PC, PDA, car device)
- ❖ Result can be based on:
  - time of day (work, home)
  - caller (don't want boss to call you at home)
  - status of callee (calls sent to voicemail when callee is already talking to someone)

# Example

Caller `jim@umass.edu`  
with places a  
call to `keith@upenn.edu`

(1) Jim sends INVITE message to umass SIP proxy.  
(2) Proxy forwards request to upenn registrar server.  
(3) upenn server returns redirect response, indicating that it should try `keith@eurecom.fr`

(4) umass proxy sends INVITE to eurecom registrar. (5) eurecom registrar forwards INVITE to 197.87.54.21, which is running keith's SIP client. (6-8) SIP response sent back (9) media sent directly between clients.

**Note:** also a SIP ack message, which is not shown.

# Improving QoS in IP Networks

**Thus far:** “making the best of best effort”

**Future:** next generation Internet with QoS guarantees

- **RSVP:** signaling for resource reservations
- **Differentiated Services:** differential guarantees
- **Integrated Services:** firm guarantees

❖ simple model for sharing and congestion studies:

# Principles for QOS Guarantees

❖ Example: 1Mbps I P phone, FTP share 1.5 Mbps link.

- bursts of FTP can congest router, cause audio loss
- want to give priority to audio over FTP

## Principle 1

packet marking needed for router to distinguish between different classes; and new router policy to treat packets accordingly

# Principles for QOS Guarantees (more)

- ❖ what if applications misbehave (audio sends higher than declared rate)
  - policing: force source adherence to bandwidth allocations
- ❖ marking and policing at network edge:
  - similar to ATM UNI (User Network Interface)

## Principle 2

provide protection (*isolation*) for one class from others

# Principles for QOS Guarantees (more)

- ❖ Allocating *fixed* (non-sharable) bandwidth to flow: *inefficient* use of bandwidth if flows doesn't use its allocation

## Principle 3

While providing isolation, it is desirable to use resources as efficiently as possible

# Principles for QOS Guarantees (more)

- ❖ *Basic fact of life:* can not support traffic demands beyond link capacity

## Principle 4

Call Admission: flow declares its needs, network may block call (e.g., busy signal) if it cannot meet needs

# Scheduling And Policing Mechanisms

---

- ❖ **scheduling**: choose next packet to send on link
- ❖ **FIFO (first in first out) scheduling**: send in order of arrival to queue
  - real-world example?
  - **discard policy**: if packet arrives to full queue: who to discard?
    - ✓ Tail drop: drop arriving packet
    - ✓ priority: drop/remove on priority basis
    - ✓ random: drop/remove randomly

# Scheduling Policies: more

- Priority scheduling:**  
transmit highest  
priority queued packet
- ❖ multiple *classes*, with different priorities
    - class may depend on marking or other header info, e.g. IP source/dest, port numbers, etc..

- Weighted Fair Queuing:**
- ❑ generalized Round Robin
  - ❑ each class gets weighted amount of service in each cycle

# Policing Mechanisms

---

**Goal:** limit traffic to not exceed declared parameters

Three common-used criteria:

- ❖ *(Long term) Average Rate:* how many pkts can be sent per unit time (in the long run)
  - crucial question: what is the interval length: 100 packets per sec or 6000 packets per min have same average!
- ❖ *Peak Rate:* e.g., 6000 pkts per min. (ppm) avg.; 1500 ppm peak rate
- ❖ *(Max.) Burst Size:* max. number of pkts sent consecutively (with no intervening idle)

# Policing Mechanisms

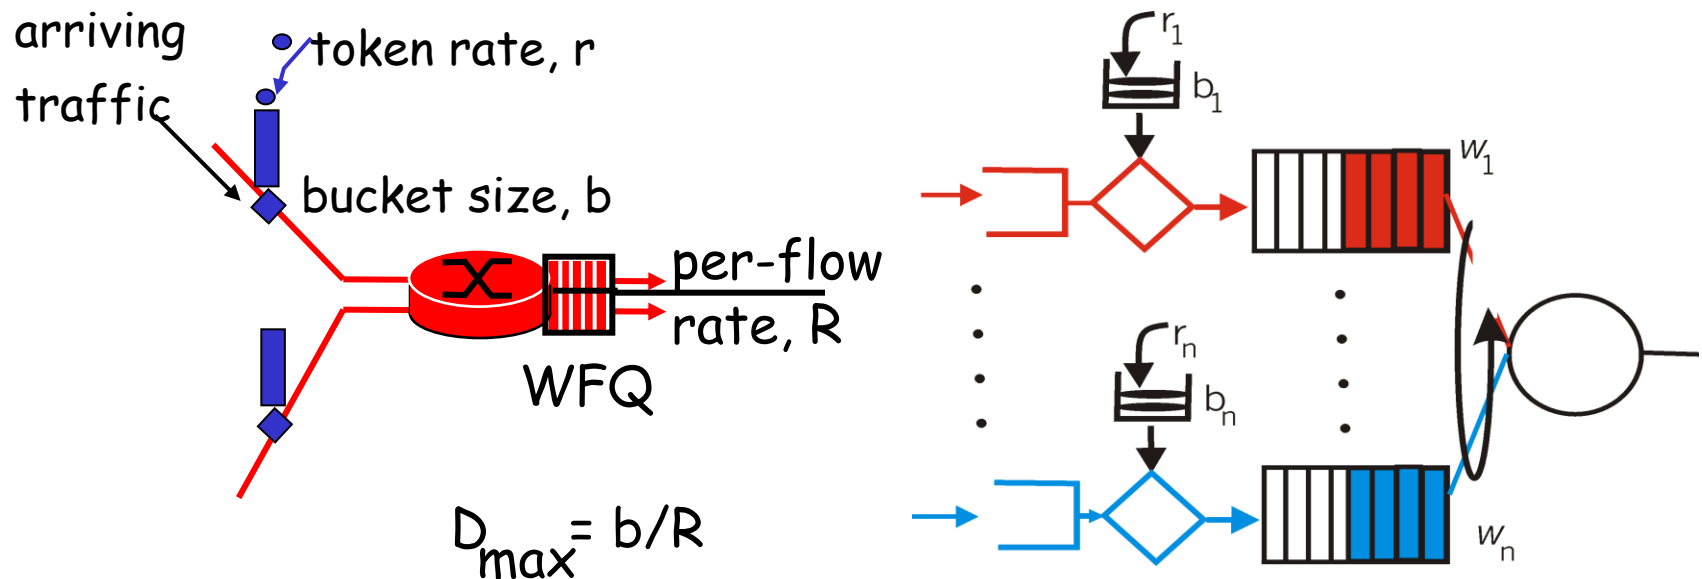

**Token Bucket:** limit input to specified Burst Size and Average Ra

- ❖ bucket can hold  $b$  tokens
- ❖ tokens generated at rate  $r$  token/sec unless bucket full
- ❖ *over interval of length  $t$ : number of packets admitted less than or equal to  $(r t + b)$ .*

# Policing Mechanisms (more)

- ❖ token bucket, WFQ combine to provide guaranteed upper bound on delay, i.e., *QoS guarantee*!

# IETF Integrated Services

---

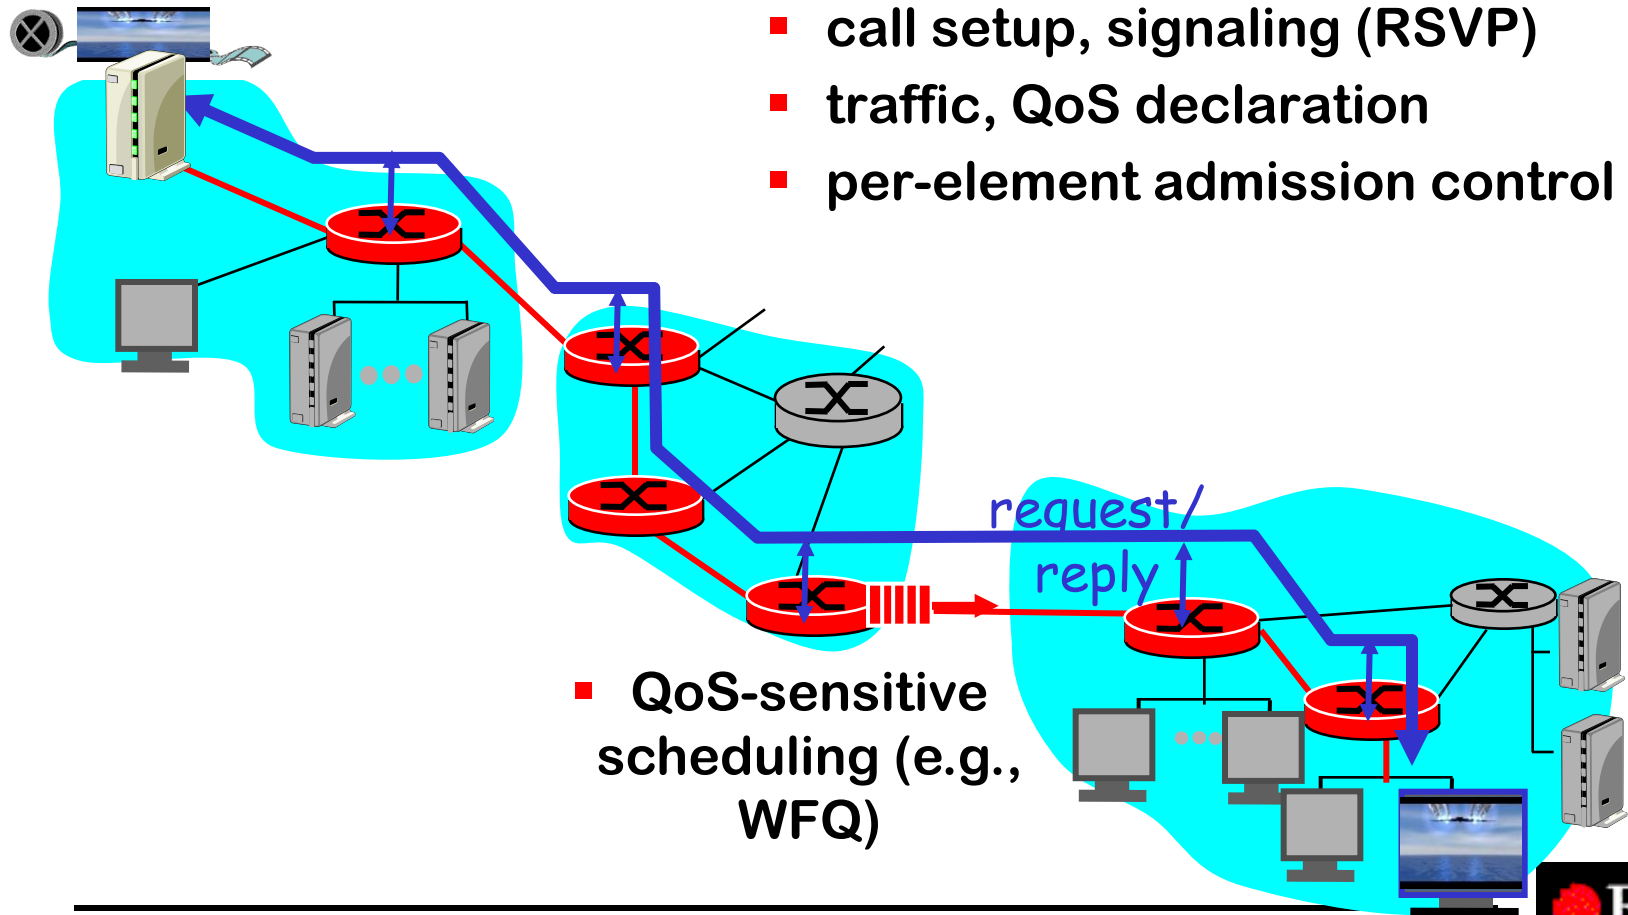

- ❖ architecture for providing QoS guarantees in IP networks for individual application sessions
- ❖ resource reservation: routers maintain state info (a la VC) of allocated resources, QoS req's
- ❖ admit/deny new call setup requests:

**Question:** can newly arriving flow be admitted with performance guarantees while not violated QoS guarantees made to already admitted flows?

## Intserv: QoS guarantee scenario

## ❖ Resource reservation

- call setup, signaling (RSVP)
- traffic, QoS declaration
- per-element admission control

- **QoS-sensitive scheduling (e.g., WFQ)**

# IETF Differentiated Services

---

## Concerns with Intserv:

- ❖ **Scalability:** signaling, maintaining per-flow router state difficult with large number of flows
- ❖ **Flexible Service Models:** Intserv has only two classes. Also want “qualitative” service classes
  - “behaves like a wire”
  - relative service distinction: Platinum, Gold, Silver

## Diffserv approach:

- ❖ simple functions in network core, relatively complex functions at edge routers (or hosts)
- ❖ Do't define service classes, provide functional components to build service classes

# Diffserv Architecture

## Edge router:

- per-flow traffic management
- marks packets as in-profile and out-profile

## Core router:

- per class traffic management
- buffering and scheduling based on marking at edge
- preference given to in-profile packets
- Assured Forwarding

# Edge-router Packet Marking

- ❖ **profile**: pre-negotiated rate A, bucket size B
- ❖ packet marking at edge based on **per-flow** profile

## Possible usage of marking:

- ❖ class-based marking: packets of different classes marked differently
- ❖ intra-class marking: conforming portion of flow marked differently than non-conforming one

# Classification and Conditioning

---

- ❖ Packet is marked in the Type of Service (TOS) in IPv4, and Traffic Class in IPv6
- ❖ 6 bits used for Differentiated Service Code Point (DSCP) and determine PHB that the packet will receive
- ❖ 2 bits are currently unused

# Forwarding (PHB)

---

## PHBs being developed:

- ❖ **Expedited Forwarding:** pkt departure rate of a class equals or exceeds specified rate
  - logical link with a minimum guaranteed rate
- ❖ **Assured Forwarding:** 4 classes of traffic
  - each guaranteed minimum amount of bandwidth
  - each with three drop preference partitions

# **Multimedia Networking: Summary**

---

- ❖ multimedia applications and requirements
- ❖ making the best of today's best effort service
- ❖ scheduling and policing mechanisms
- ❖ next generation Internet: Intserv, RSVP, Diffserv

# Summary

---

- ❖ In this lecture, we have understood:
  - Emerging multimedia applications like video streaming, SIP etc.
  - Network services the apps need
  - Mechanisms for providing QoS Network components

# Next Time

---

**Good Luck ! Happy Exam !**
